Suggest me a Collect service for reading the content of a CSV file.

Base your answer only on the atomic services provided in the given context <context>**{context}**</context>

Based on the context information provided, there are two Collect services defined: `srv2` and `srv4`. Both services have an endpoint for reading the content of a file, but they differ in the format of the expected file: `srv2` expects a CSV file and returns it as `text/csv` format, while `srv4` expects a JSON file and returns it as `application/json` format.

To answer your question, you can find the service for reading the content of a CSV file by looking at the `"paths"` object in the `srv2` OpenAPI definition, specifically the `"/read-csv"` endpoint under that object:

```
```json
"paths": {
  "/read-csv": {
    "get": { ... }
  }
}
```
```

This endpoint defines the parameters and responses for reading the content of a CSV file using a GET request. The required parameter is `file_path`, which specifies the path to the CSV file, and the optional parameters are `projection_attributes` and `filter_expression`. The response includes a successful response with the CSV data returned as `text/csv` format.
