Based on the context information provided, there are two Collect
services defined: srv2 and srv4. Both services have an endpoint for
reading the content of a file, but they differ in the format of the
expected file: srv2 expects a CSV file and returns it as text/csv
format, while srv4 expects a JSON file and returns it as
application/json format.

To answer your question, you can find the service for reading the
content of a CSV file by looking at the `"paths"` object in the srv2
OpenAPI definition, specifically the `"/read-csv"` endpoint under that
object:

```json
"paths": {
  "/read-csv": {
    "get": { ... }
  }
}
```

This endpoint defines the parameters and responses for reading the
content of a CSV file using a GET request. The required parameter is
`file_path`, which specifies the path to the CSV file, and the optional
parameters are `projection_attributes` and `filter_expression`. The
response includes a successful response with the CSV data returned as
text/csv format.
